

DonorsChoose

DonorsChoose.org receives hundreds of thousands of project proposals each year for classroom projects in need of funding. Right now, a large number of volunteers is needed to manually screen each submission before it's approved to be posted on the DonorsChoose.org website.

Next year, DonorsChoose.org expects to receive close to 500,000 project proposals. As a result, there are three main problems they need to solve:

- How to scale current manual processes and resources to screen 500,000 projects so that they can be posted as quickly and as efficiently as possible
- How to increase the consistency of project vetting across different volunteers to improve the experience for teachers
- How to focus volunteer time on the applications that need the most assistance

The goal of the competition is to predict whether or not a DonorsChoose.org project proposal submitted by a teacher will be approved, using the text of project descriptions as well as additional metadata about the project, teacher, and school. DonorsChoose.org can then use this information to identify projects most likely to need further review before approval.

About the DonorsChoose Data Set

The `train.csv` data set provided by DonorsChoose contains the following features:

Feature	Description
<code>project_id</code>	A unique identifier for the proposed project. Example: p036502
<code>project_title</code>	Title of the project. Examples: <ul style="list-style-type: none">• Art Will Make You Happy!• First Grade Fun
<code>project_grade_category</code>	Grade level of students for which the project is targeted. One of the following enumerated values: <ul style="list-style-type: none">• Grades PreK-2• Grades 3-5• Grades 6-8• Grades 9-12
<code>project_subject_categories</code>	One or more (comma-separated) subject categories for the project from the following enumerated list of values: <ul style="list-style-type: none">• Applied Learning• Care & Hunger• Health & Sports• History & Civics• Literacy & Language• Math & Science• Music & The Arts• Special Needs• Warmth Examples: <ul style="list-style-type: none">• Music & The Arts• Literacy & Language, Math & Science
<code>school_state</code>	State where school is located (Two-letter U.S. postal code). Example: WY
<code>project_subject_subcategories</code>	One or more (comma-separated) subject subcategories for the project. Examples: <ul style="list-style-type: none">• Literacy

Feature	Description
<code>project_resource_summary</code>	An explanation of the resources needed for the project. Example: <ul style="list-style-type: none"> My students need hands on literacy materials to manage sensory needs!
<code>project_essay_1</code>	First application essay*
<code>project_essay_2</code>	Second application essay*
<code>project_essay_3</code>	Third application essay*
<code>project_essay_4</code>	Fourth application essay*
<code>project_submitted_datetime</code>	Datetime when project application was submitted. Example: 2016-04-28 12:43:56.245
<code>teacher_id</code>	A unique identifier for the teacher of the proposed project. Example: bdf8baa8fedef6bfeec7ae4ff1c15c56
<code>teacher_prefix</code>	Teacher's title. One of the following enumerated values: <ul style="list-style-type: none"> nan Dr. Mr. Mrs. Ms. Teacher.
<code>teacher_number_of_previously_posted_projects</code>	Number of project applications previously submitted by the same teacher. Example: 2

* See the section **Notes on the Essay Data** for more details about these features.

Additionally, the `resources.csv` data set provides more data about the resources required for each project. Each line in this file represents a resource required by a project:

Feature	Description
<code>id</code>	A <code>project_id</code> value from the <code>train.csv</code> file. Example: p036502
<code>description</code>	Description of the resource. Example: Tenor Saxophone Reeds, Box of 25
<code>quantity</code>	Quantity of the resource required. Example: 3
<code>price</code>	Price of the resource required. Example: 9.95

Note: Many projects require multiple resources. The `id` value corresponds to a `project_id` in `train.csv`, so you use it as a key to retrieve all resources needed for a project:

The data set contains the following label (the value you will attempt to predict):

Label	Description
<code>project_is_approved</code>	A binary flag indicating whether DonorsChoose approved the project. A value of 0 indicates the project was not approved, and a value of 1 indicates the project was approved.

Notes on the Essay Data

Prior to May 17, 2016, the prompts for the essays were as follows:

- `__project_essay_1__` "Introduce us to your classroom"
- `__project_essay_2__` "Tell us more about your students"
- `__project_essay_3__` "Describe how your students will use the materials you're requesting"
- `__project_essay_4__` "Close by sharing why your project will make a difference"

Starting on May 17, 2016, the number of essays was reduced from 4 to 2, and the prompts for the first 2 essays were changed to the following:

- `__project_essay_1__` "Describe your students: What makes your students special? Specific details about their background, your neighborhood, and your school are all helpful."

your neighborhood, and your school are all helpful.

- __project_essay_2__: "About your project: How will these materials make a difference in your students' learning and improve their school lives?"

For all projects with project_submitted_datetime of 2016-05-17 and later, the values of project_essay_3 and project_essay_4 will be NaN.

1.1 Reading Data

In [2]:

```
project_data = pd.read_csv('train_data.csv', nrows=50000)
resource_data = pd.read_csv('resources.csv')
```

OBSERVATION: The above block takes all records from the data to perform analysis.

In [3]:

```
print("Number of data points in train data", project_data.shape)
print('-'*50)
print("The attributes of data :", project_data.columns.values)
```

Number of data points in train data (50000, 17)

The attributes of data : ['Unnamed: 0' 'id' 'teacher_id' 'teacher_prefix' 'school_state'
'project_submitted_datetime' 'project_grade_category'
'project_subject_categories' 'project_subject_subcategories'
'project_title' 'project_essay_1' 'project_essay_2' 'project_essay_3'
'project_essay_4' 'project_resource_summary']

```
'teacher_number_of_previously_posted_projects' 'project_is_approved']
```

OBSERVATION: There are 109248 rows and 17 columns in the 'project_data' data frame.

In [4]:

```
print("Number of data points in resources data", resource_data.shape)
print(resource_data.columns.values)
resource_data.head(2)
```

```
Number of data points in resources data (1541272, 4)
['id' 'description' 'quantity' 'price']
```

Out[4]:

	id	description	quantity	price
0	p233245	LC652 - Lakeshore Double-Space Mobile Drying Rack	1	149.00
1	p069063	Bouncy Bands for Desks (Blue support pipes)	3	14.95

OBSERVATION: The above block shows the number of columns(4) and rows(1541272) in the resources file.

1.2 Data Analysis

In [5]:

```
# PROVIDE CITATIONS TO YOUR CODE IF YOU TAKE IT FROM ANOTHER WEBSITE.
# https://matplotlib.org/gallery/pie_and_polar_charts/pie_and_donut_labels.html#sphx-glr-gallery-pie-and-polar-charts-pie-and-donut-labels-py
```

```
y_value_counts = project_data['project_is_approved'].value_counts()
print("Number of projects that are approved for funding ", y_value_counts[1], ", (",
      (y_value_counts[1]/(y_value_counts[1]+y_value_counts[0]))*100,"%")
print("Number of projects that are not approved for funding ", y_value_counts[0], ", (",
      (y_value_counts[0]/(y_value_counts[1]+y_value_counts[0]))*100,"%")
```

```
fig, ax = plt.subplots(figsize=(6, 6), subplot_kw=dict(aspect="equal"))
recipe = ["Accepted", "Not Accepted"]
```

```
data = [y_value_counts[1], y_value_counts[0]]
```

```
wedges, texts = ax.pie(data, wedgeprops=dict(width=0.6), startangle=40)
```

```
bbox_props = dict(boxstyle="square,pad=0.3", fc="w", ec="k", lw=0.72)
kw = dict(xycoords='data', textcoords='data', arrowprops=dict(arrowstyle="-"),
          bbox=bbox_props, zorder=0, va="center")
```

```
for i, p in enumerate(wedges):
    ang = (p.theta2 - p.theta1)/2. + p.theta1
    y = np.sin(np.deg2rad(ang))
    x = np.cos(np.deg2rad(ang))
    horizontalalignment = {-1: "right", 1: "left"}[int(np.sign(x))]
    connectionstyle = "angle,angleA=0,angleB={}".format(ang)
    kw["arrowprops"].update({"connectionstyle": connectionstyle})
    ax.annotate(recipe[i], xy=(x, y), xytext=(1.35*np.sign(x), 1.4*y),
                horizontalalignment=horizontalalignment, **kw)
```

```
ax.set_title("Number of projects that are Accepted and not accepted")
```

```
plt.show()
```

```
Number of projects that are approved for funding 42286 , ( 84.572 %)
```

```
Number of projects that are not approved for funding 7714 , ( 15.428 %)
```

Number of projects that are Accepted and not accepted

OBSERVATION: The above block gives the percentage of projects that are approved(85%) and not approved(15%) for funding, in the form of statements and pie chart.

1.2.1 Univariate Analysis: School State

In [6]:

```
# Pandas dataframe groupby count, mean: https://stackoverflow.com/a/19385591/4084039

temp = pd.DataFrame(project_data.groupby("school_state")
["project_is_approved"].apply(np.mean)).reset_index()
#print(temp.head())
# if you have data which contain only 0 and 1, then the mean = percentage (think about it)
temp.columns = ['state_code', 'num_proposals']

'''# How to plot US state heatmap: https://datascience.stackexchange.com/a/9620

scl = [[0.0, 'rgb(242,240,247)'],[0.2, 'rgb(218,218,235)'],[0.4, 'rgb(188,189,220)'],\
       [0.6, 'rgb(158,154,200)'],[0.8, 'rgb(117,107,177)'],[1.0, 'rgb(84,39,143)']]

data = [ dict(
    type='choropleth',
    colorscale = scl,
    autocolorscale = False,
    locations = temp['state_code'],
    z = temp['num_proposals'].astype(float),
    locationmode = 'USA-states',
    text = temp['state_code'],
    marker = dict(line = dict (color = 'rgb(255,255,255)',width = 2)),
    colorbar = dict(title = "% of pro")
) ]

layout = dict(
    title = 'Project Proposals % of Acceptance Rate by US States',
    geo = dict(
        scope='usa',
        projection=dict( type='albers usa' ),
        showlakes = True,
        lakecolor = 'rgb(255, 255, 255)',
    ),
)

fig = go.Figure(data=data, layout=layout)
offline.iplot(fig, filename='us-map-heat-map')
'''
```

Out[6]:

```
# How to plot US state heatmap: https://datascience.stackexchange.com/a/9620\nnscl = [[0.0, \\'rg  
b(242,240,247)\\'], [0.2, \\'rgb(218,218,235)\\'], [0.4, \\'rgb(188,189,220)\\'], [0.6, \\'rgb(1  
58,154,200)\\'], [0.8, \\'rgb(117,107,177)\\'], [1.0, \\'rgb(84,39,143)\\']]  
\nndata = [ dict(\n    ty

\nfig =  
go.Figure(data=data, layout=layout)\noffline.iplot(fig, filename=\\'us-map-heat-map\\')  
\n'
```

OBSERVATION: The above block groups the 'project_data' data frame on 'school_state' and calculates the mean of the total projects approved per state to store in temp.

In [7]:

```
# https://www.csi.cuny.edu/sites/default/files/pdf/administration/ops/2letterstabbrev.pdf
temp.sort_values(by=['num_proposals'], inplace=True)
print("States with lowest % approvals")
print(temp.head(5))
print('='*50)
print("States with highest % approvals")
print(temp.tail(5))
```

States with lowest % approvals

	state_code	num_proposals
26	MT	0.764151
46	VT	0.781250
7	DC	0.785425
43	TX	0.803916
13	ID	0.804636

States with highest % approvals

	state_code	num_proposals
35	OH	0.877966
30	NH	0.879433
6	CT	0.882429
47	WA	0.888486
28	ND	0.904762

OBSERVATION: Above block lists out the states with their project approval percentage. The state VT has the lowest approval percentage(80%) and the highest value(89%) belongs to DE.

In [8]:

```
#stacked bar plots matplotlib:
https://matplotlib.org/gallery/lines_bars_and_markers/bar_stacked.html
def stack_plot(data, xtick, col2='project_is_approved', col3='total'):
    ind = np.arange(data.shape[0])

    plt.figure(figsize=(20,5))
    p1 = plt.bar(ind, data[col3].values)
    p2 = plt.bar(ind, data[col2].values)

    plt.ylabel('Projects')
    plt.title('Number of projects aproved vs rejected')
    plt.xticks(ind, list(data[xtick].values))
    plt.legend((p1[0], p2[0]), ('total', 'accepted'))
    plt.show()
```

In [9]:

```
def univariate_barplots(data, col1, col2='project_is_approved', top=False):
    # Count number of zeros in dataframe python: https://stackoverflow.com/a/51540521/4084039
    temp = pd.DataFrame(project_data.groupby(col1)[col2].agg(lambda x: x.eq(1).sum())).reset_index()

    # Pandas dataframe grouby count: https://stackoverflow.com/a/19385591/4084039
    temp['total'] = pd.DataFrame(project_data.groupby(col1)
[col2].agg({'total': 'count'})).reset_index()['total']
    temp['Avg'] = pd.DataFrame(project_data.groupby(col1)[col2].agg({'Avg': 'mean'})).reset_index()['Avg']

    temp.sort_values(by=['total'],inplace=True, ascending=False)

    if top:
        temp = temp[0:top]

    stack_plot(temp, xtick=col1, col2=col2, col3='total')
    print(temp.head(5))
    print('='*50)
    print(temp.tail(5))
```

In [10]:

```
univariate_barplots(project_data, 'school_state', 'project_is_approved', False)
```

	school_state	project_is_approved	total	Avg
4	CA	6013	7024	0.856065
34	NY	2903	3393	0.855585
43	TX	2669	3320	0.803916
9	FL	2328	2839	0.820007
27	NC	2006	2340	0.857265

	school_state	project_is_approved	total	Avg
39	RI	107	126	0.849206
26	MT	81	106	0.764151
28	ND	57	63	0.904762
50	WY	42	51	0.823529
46	VT	25	32	0.781250

SUMMARY: Every state has greater than 80% success rate in approval

OBSERVATION: The above plot and the output show that the approval percentage of all the states remain almost same, regardless of the state and the number of projects proposed by those states. The state CA has proposed most number of projects and VT proposed least number of projects with approval percentage of 85.81 and 80 respectively.

1.2.2 Univariate Analysis: teacher_prefix

In [11]:

```
univariate_barplots(project_data, 'teacher_prefix', 'project_is_approved' , top=False)
```

	teacher_prefix	project_is_approved	total	Avg
2	Mrs.	22239	26140	0.850765
3	Ms.	15124	17936	0.843220
1	Mr.	4073	4859	0.838238
4	Teacher	847	1061	0.798303
0	Dr.	1	2	0.500000

	teacher_prefix	project_is_approved	total	Avg
2	Mrs.	22239	26140	0.850765
3	Ms.	15124	17936	0.843220
1	Mr.	4073	4859	0.838238
4	Teacher	847	1061	0.798303
0	Dr.	1	2	0.500000

OBSERVATION: The above info shows that there are more projects proposed by teachers with 'Mrs.' prefix followed by 'Ms.' and 'Mr.'. There are very few projects proposed by teachers having a doctorate. This may be because, there may be more number of lady teachers and very few techers with a doctorate.

1.2.3 Univariate Analysis: project_grade_category

In [12]:

```
univariate_barplots(project_data, 'project_grade_category', 'project_is_approved', top=False)
```

project_grade_category	project_is_approved	total	Avg
3 Grades PreK-2	17185	20316	0.845885
0 Grades 3-5	14466	16968	0.852546
1 Grades 6-8	6503	7750	0.839097
2 Grades 9-12	4132	4966	0.832058

project_grade_category	project_is_approved	total	Avg
3 Grades PreK-2	17185	20316	0.845885
0 Grades 3-5	14466	16968	0.852546
1 Grades 6-8	6503	7750	0.839097
2 Grades 9-12	4132	4966	0.832058

OBSERVATION: Above plots show that approval percentage of projects remain almost same for all the grades. But the number of projects sent for approval reduces at higher grades.

1.2.4 Univariate Analysis: project_subject_categories

In [13]:

```
categories = list(project_data['project_subject_categories'].values)
# remove special characters from list of strings python:
https://stackoverflow.com/a/47301924/4084039

# https://www.geeksforgeeks.org/removing-stop-words-nltk-python/
# https://stackoverflow.com/questions/23669024/how-to-strip-a-specific-word-from-a-string
# https://stackoverflow.com/questions/8270092/remove-all-whitespace-in-a-string-in-python
cat_list = []
for i in categories:
    temp = ""
    # consider we have text like this "Math & Science, Warmth, Care & Hunger"
    for j in i.split(','): # it will split it in three parts ["Math & Science", "Warmth", "Care & Hunger"]
        if 'The' in j.split(): # this will split each of the catogory based on space "Math & Science" => "Math", "&", "Science"
            j = j.replace('The', '') # if we have the words "The" we are going to replace it with '' (i.e removing 'The')
            j = j.replace(' ', '') # we are placing all the ' ' (space) with '' (empty) ex: "Math & Science" => "Math&Science"
            temp += j.strip() + " " # " abc ".strip() will return "abc", remove the trailing spaces
            temp = temp.replace('&', '_') # we are replacing the & value into
    cat_list.append(temp.strip())
```

In [14]:

```
project_data['clean_categories'] = cat_list
project_data.drop(['project_subject_categories'], axis=1, inplace=True)
project_data.head(2)
```

Out[14]:

	Unnamed: 0	id	teacher_id	teacher_prefix	school_state	project_submitted_datetime	pro
0	160221	p253737	c90749f5d961ff158d4b4d1e7dc665fc	Mrs.	IN	2016-12-05 13:43:57	Gra
1	140945	p258326	897464ce9ddc600bcd1151f324dd63a	Mr.	FL	2016-10-25 09:22:10	Gra

In [15]:

```
univariate_barplots(project_data, 'clean_categories', 'project_is_approved', top=20)
```

```
clean_categories project_is_approved total Avg
23 Literacy_Language 9444 10927 0.864281
31 Math_Science 6307 7695 0.819623
27 Literacy_Language Math_Science 5805 6705 0.865772
8 Health_Sports 3976 4700 0.845957
39 Music_Arts 2021 2358 0.857082
=====
clean_categories project_is_approved total Avg
19 History_Civics Literacy_Language 595 651 0.913978
14 Health_Sports SpecialNeeds 547 633 0.864139
49 Warmth Care_Hunger 561 606 0.925743
32 Math_Science AppliedLearning 474 565 0.838938
4 AppliedLearning Math_Science 386 477 0.809224
```

OBSERVATION: More number of projects are suggested for the 'Literacy_Language' category and less number of categories for 'AppliedLearning Math_Science'. Even though we don't see a major change in approval percentage for any category, 'Warmth Care_Hunger' has high approval percentage. May be these projects are related to some of the basic amenities required by the students.

In [16]:

```
# count of all the words in corpus python: https://stackoverflow.com/a/22898595/4084039
from collections import Counter
my_counter = Counter()
for word in project_data['clean_categories'].values:
    my_counter.update(word.split())
```

In [17]:

```
# dict sort by value python: https://stackoverflow.com/a/613218/4084039
cat_dict = dict(my_counter)
sorted_cat_dict = dict(sorted(cat_dict.items(), key=lambda kv: kv[1]))

ind = np.arange(len(sorted_cat_dict))
plt.figure(figsize=(20,5))
p1 = plt.bar(ind, list(sorted_cat_dict.values()))
```

```
plt.ylabel('Projects')
plt.title('% of projects aproved category wise')
plt.xticks(ind, list(sorted_cat_dict.keys()))
plt.show()
```

In [18]:

```
for i, j in sorted_cat_dict.items():
    print("{:20} :{:10}".format(i,j))
```

```
Warmth           :      643
Care_Hunger      :      643

Health_Sports    :     6538
Math_Science     :    18874
Literacy_Language :    23998
```

OBSERVATION: When projects with multiple categories are split and the number of projects for each category are taken, the counts will be as shown above.

1.2.5 Univariate Analysis: project_subject_subcategories

In [19]:

```
sub_categories = list(project_data['project_subject_subcategories'].values)
# remove special characters from list of strings python:
https://stackoverflow.com/a/47301924/4084039

# https://www.geeksforgeeks.org/removing-stop-words-nltk-python/
# https://stackoverflow.com/questions/23669024/how-to-strip-a-specific-word-from-a-string
# https://stackoverflow.com/questions/8270092/remove-all-whitespace-in-a-string-in-python

sub_cat_list = []
for i in sub_categories:
    temp = ""
    # consider we have text like this "Math & Science, Warmth, Care & Hunger"
    for j in i.split(','): # it will split it in three parts ["Math & Science", "Warmth", "Care & Hunger"]
        if 'The' in j.split(): # this will split each of the category based on space "Math & Science" => "Math", "&", "Science"
            j = j.replace('The', '') # if we have the words "The" we are going to replace it with '' (i.e removing 'The')
            j = j.replace(' ', '') # we are placing all the ' ' (space) with '' (empty) ex: "Math & Science" => "Math&Science"
            temp += j.strip() + " #"
        temp = temp.replace('&', '_')
    sub_cat_list.append(temp.strip())
```

In [20]:

```
project_data['clean_subcategories'] = sub_cat_list
project_data.drop(['project_subject_subcategories'], axis=1, inplace=True)
project_data.head(2)
```

```

OBSERVATION: When projects with multiple subcategories are split and the number of projects for each subcategory are taken, the counts will be as shown above.

1.2.6 Univariate Analysis: Text features (Title)

In [25]:

```
#How to calculate number of words in a string in DataFrame:
https://stackoverflow.com/a/37483537/4084039
word_count = project_data['project_title'].str.split().apply(len).value_counts()
word_dict = dict(word_count)
word_dict = dict(sorted(word_dict.items(), key=lambda kv: kv[1]))

ind = np.arange(len(word_dict))
plt.figure(figsize=(20,5))
p1 = plt.bar(ind, list(word_dict.values()))

plt.ylabel('Numeber of projects')
plt.xlabel('Numeber words in project title')
```

```
plt.title('Words for each title of the project')
plt.xticks(ind, list(word_dict.keys()))
plt.show()
```

OBSERVATION: The above plot shows that the majority of the projects contains 3,4,5 words. Where as there are very less number of projects with more number of words(11,12,13).

In [26]:

```
approved_title_word_count = project_data[project_data['project_is_approved']==1]['project_title'].
str.split().apply(len)
approved_title_word_count = approved_title_word_count.values

rejected_title_word_count = project_data[project_data['project_is_approved']==0]['project_title'].
str.split().apply(len)
rejected_title_word_count = rejected_title_word_count.values
```

In [27]:

```
# https://glowingpython.blogspot.com/2012/09/boxplot-with-matplotlib.html
plt.boxplot([approved_title_word_count, rejected_title_word_count])
plt.xticks([1,2], ('Approved Projects', 'Rejected Projects'))
plt.ylabel('Words in project title')
plt.grid()
plt.show()
```

OBSERVATION: The above box plots show that the majority of approved projects contain 4-7 words in the title. And the majority un-approved projects contain 3-6 words in title. Since more number of words imply better explanation of detail, more words in title allows the projects to get approved.

In [28]:

```
plt.figure(figsize=(10,3))
sns.kdeplot(approved_title_word_count,label="Approved Projects", bw=0.6)
sns.kdeplot(rejected_title_word_count,label="Not Approved Projects", bw=0.6)
plt.legend()
plt.show()
```

OBSERVATION: The kernel density estimate plot of both approved and un-approved projects are similar to each other and we can't infer much from this.

1.2.7 Univariate Analysis: Text features (Project Essay's)

In [29]:

```
# merge two column text dataframe:
project_data["essay"] = project_data["project_essay_1"].map(str) + \
    project_data["project_essay_2"].map(str) + \
    project_data["project_essay_3"].map(str) + \
    project_data["project_essay_4"].map(str)
```

In [30]:

```
approved_word_count = project_data[project_data['project_is_approved']==1]['essay'].str.split().apply(len)
approved_word_count = approved_word_count.values

rejected_word_count = project_data[project_data['project_is_approved']==0]['essay'].str.split().apply(len)
rejected_word_count = rejected_word_count.values
```

In [31]:

```
# https://glowingpython.blogspot.com/2012/09/boxplot-with-matplotlib.html
plt.boxplot([approved_word_count, rejected_word_count])
plt.title('Words for each essay of the project')
plt.xticks([1,2], ('Approved Projects', 'Rejected Projects'))
plt.ylabel('Words in project essays')
plt.grid()
plt.show()
```

OBSERVATION: The above box plots show that the projects submitted with more number of words in the essays had better chance of approval than the projects with less words in their essays. This may be due to better explanation of projects which may be an implication due to more number of words.

In [32]:

```
plt.figure(figsize=(10,3))
sns.distplot(approved_word_count, hist=False, label="Approved Projects")
sns.distplot(rejected_word_count, hist=False, label="Not Approved Projects")
plt.title('Words for each essay of the project')
plt.xlabel('Number of words in each eassay')
plt.legend()
plt.show()
```

OBSERVATION: The above plot shows that the projects with less number of words in the essays have more chance of getting rejected than the projects with more words in their essays.

1.2.8 Univariate Analysis: Cost per project

In [33]:

```
# we get the cost of the project using resource.csv file
resource_data.head(2)
```

Out[33]:

	id	description	quantity	price
0	p233245	LC652 - Lakeshore Double-Space Mobile Drying Rack	1	149.00
1	p069063	Bouncy Bands for Desks (Blue support pipes)	3	14.95

In [34]:

```
# https://stackoverflow.com/questions/22407798/how-to-reset-a-dataframes-indexes-for-all-groups-in-one-step
price_data = resource_data.groupby('id').agg({'price':'sum', 'quantity':'sum'}).reset_index()
price_data.head(2)
```

Out[34]:

	id	price	quantity
0	p000001	459.56	7
1	p000002	515.89	21

In [35]:

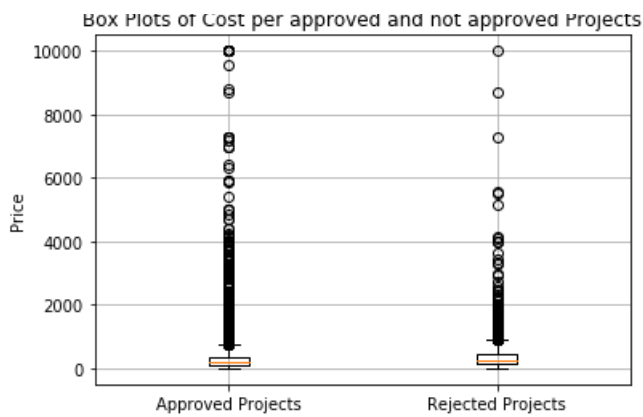

```
# join two dataframes in python:
project_data = pd.merge(project_data, price_data, on='id', how='left')
```

In [36]:

```
approved_price = project_data[project_data['project_is_approved']==1]['price'].values
rejected_price = project_data[project_data['project_is_approved']==0]['price'].values
```

In [37]:

```
# https://glowingpython.blogspot.com/2012/09/boxplot-with-matplotlib.html
plt.boxplot([approved_price, rejected_price])
plt.title('Box Plots of Cost per approved and not approved Projects')
plt.xticks([1,2], ('Approved Projects', 'Rejected Projects'))
plt.ylabel('Price')
plt.grid()
plt.show()
```

OBSERVATION: The above box plots does not reveal much info on the role played by price of project, in order for the project to be selected.

In [38]:

```
plt.figure(figsize=(10,3))
sns.distplot(approved_price, hist=False, label="Approved Projects")
sns.distplot(rejected_price, hist=False, label="Not Approved Projects")
plt.title('Cost per approved and not approved Projects')
plt.xlabel('Cost of a project')
plt.legend()
plt.show()
```

OBSERVATION: The distribution plot also doesn't reveal much about the part played by the price of project, in order for the project to be selected.

In [39]:

```
# http://zetcode.com/python/prettytable/
from prettytable import PrettyTable

#If you get a ModuleNotFoundError error , install prettytable using: pip3 install prettytable

x = PrettyTable()
x.field_names = ["Percentile", "Approved Projects", "Not Approved Projects"]

for i in range(0,101,5):
    x.add_row([i,np.round(np.percentile(approved_price,i), 3), np.round(np.percentile(rejected_price,i), 3)])
print(x)
```

Percentile	Approved Projects	Not Approved Projects
0	0.66	1.97
5	13.772	41.429
10	33.99	73.18
15	58.57	98.548
20	78.64	118.006
25	99.99	140.785
30	117.035	161.972
35	137.08	183.825
40	157.0	208.726
45	177.802	234.921
50	198.085	261.255

	55		221.808		292.798	
	60		254.0		322.998	
	65		283.812		359.934	
	70		319.975		399.99	
	75		364.265		446.437	
	80		409.98		517.156	
	85		479.0		615.586	
	90		592.99		742.624	
	95		805.89		991.616	
	100		9999.0		9999.0	
+-----+-----+-----+						

OBSERVATION: The percentiles in above table reveals that, the price quoted for the approved projects are comparatively less than that of the non-approved projects.

1.2.9 Univariate Analysis: teacher_number_of_previously_posted_projects

In [40]:

```
univariate_barplots(project_data, 'teacher_number_of_previously_posted_projects',
'project_is_approved' , top=False)
```

	teacher_number_of_previously_posted_projects	project_is_approved	total \
0	0	11260	13735
1	1	6055	7352
2	2	3944	4709
3	3	2690	3199
4	4	2032	2399

	Avg
0	0.819803
1	0.823585
2	0.837545
3	0.840888
4	0.847020

```
=====
teacher_number_of_previously_posted_projects  project_is_approved  total \
250                                           266                    1      1
249                                           265                    1      1
247                                           262                    1      1
245                                           260                    1      1
326                                           428                    1      1
```

	Avg
250	1.0
249	1.0
247	1.0
245	1.0
326	1.0

OBSERVATION: The above analysis show that there is an approval percentage of above 80% regardless of the number of projects proposed by the teacher. However the approval percentage is more for teachers who have less number previously proposed projects.

1.2.10 Univariate Analysis: project_resource_summary

In [41]:

```
project_data.columns.values

My students are English learners that are working on English as their second or third languages. We are a melting pot of refugees, immigrants, and native-born Americans bringing the gift of language to our school. \r\n\r\n We have over 24 languages represented in our English Learner program with students at every level of mastery. We also have over 40 countries represented with the families within our school. Each student brings a wealth of knowledge and experiences to us that open our eyes to new cultures, beliefs, and respect.\"The limits of your language are the limits of your world.\"-Ludwig Wittgenstein Our English learner's have a strong support system at home that begs for more resources. Many times our parents are learning to read and speak English alongside of their children. Sometimes this creates barriers for parents to be able to help their child learn phonetics, letter recognition, and other reading skills.\r\n\r\nBy providing these dvd's and players, students are able to continue their mastery of the English language even if no one at home is able to assist. All families with students within the Level 1 proficiency status, will be offered to be a part of this program. These educational videos will be specially chosen by the English Learner Teacher and will be sent home regularly to watch. The videos are to help the child develop early reading skills.\r\n\r\nParents that do not have access to a dvd player will have the opportunity to check out a dvd player to use for the year. The plan is to use these videos and educational dvd's for the years to come for other EL students.\r\nnnnnnn

=====

The 51 fifth grade students that will cycle through my classroom this year all love learning, at least most of the time. At our school, 97.3% of the students receive free or reduced price lunch. Of the 560 students, 97.3% are minority students. \r\nThe school has a vibrant community that loves to get together and celebrate. Around Halloween there is a whole school parade to show off the beautiful costumes that students wear. On Cinco de Mayo we put on a big festival with crafts made by the students, dances, and games. At the end of the year the school hosts a carnival to celebrate the hard work put in during the school year, with a dunk tank being the most popular activity. My students will use these five brightly colored Hokki stools in place of regular, stationary, 4-legged chairs. As I will only have a total of ten in the classroom and not enough for each student to have an individual one, they will be used in a variety of ways. During independent reading time they will be used as special chairs students will each use on occasion. I will utilize them in place of chairs at my small group tables during math and reading times. The rest of the day they will be used by the students who need the highest amount of movement in their life in order to stay focused on school.\r\n\r\nWhenever asked what the classroom is missing, my students always say more Hokki Stools. They can't get their fill of the 5 stools we already have. When the students are sitting in a group with me on the Hokki Stools, they are always moving, but at the same time doing their work. Anytime the students get to pick where they can sit, the Hokki Stools are the first to be taken. There are always students who head over to the kidney table to get one of the stools who are disappointed as there are not enough of them. \r\n\r\nWe ask a lot of students to sit for 7 hours a day. The Hokki stools will be a compromise that allow my students to do desk work and move at the same time. These stools will help students to meet their 60 minutes a day of movement by allowing them to activate their core muscles for balance while they sit. For many of my students, these chairs will take away the barrier that exists in schools for a child who can't sit still.nnnnn

=====

How do you remember your days of school? Was it in a sterile environment with plain walls, rows of desks, and a teacher in front of the room? A typical day in our room is nothing like that. I work hard to create a warm inviting themed room for my students look forward to coming to each day.\r\n\r\nMy class is made up of 28 wonderfully unique boys and girls of mixed races in Arkansas.\r\nThey attend a Title I school, which means there is a high enough percentage of free and reduced-price lunch to qualify. Our school is an \"open classroom\" concept, which is very unique as there are no walls separating the classrooms. These 9 and 10 year-old students are very eager learners; they are like sponges, absorbing all the information and experiences and keep on wanting more. With these resources such as the comfy red throw pillows and the whimsical nautical hanging decor and the blue fish nets, I will be able to help create the mood in our classroom setting to be one of a themed nautical environment. Creating a classroom environment is very important in the success in each and every child's education. The nautical photo props will be used with each child as they step foot into our classroom for the first time on Meet the Teacher evening. I'll take pictures of each child with them, have them developed, and then hung in our classroom ready for their first day of 4th grade. This kind gesture will set the tone before even the first day of school! The nautical thank you cards will be used throughout the year by the students as they create thank you cards to their team groups.\r\n\r\nYour generous donations will help me to help make our classroom a fun, inviting, learning environment from day one.\r\n\r\nIt costs a lot of money out of my own pocket on resources to get our classroom ready. Please consider helping with this project to make our new school year a very successful one. Thank you!nnnnn

=====

My class is made up of students from various grade levels. We work hard in filling learning gaps and have students reach grade level. My students are dealing with emotional issues that make it hard for them to handle frustration with tasks and need a lot of individual attention. By learning to work independently, my students will have the chance to mainstream into other classrooms with their peer groups. Our biggest goal with my students is for them to learn not only to control their emotions but to learn how to be students. Many of them have spent a large amount of time absent from school for different reasons and need to get into the routine of being in class and on task all day. Modeling good classroom routines and task is important for them to master and move back into general education classrooms. Being apart of a Title 1 school means resources that students need a

re massive and a lot of supplies are shared with parents to make sure homework is completed. Bouncy Bands will give my students a way to get rid of anxiety, tension, and energy all while staying at their desk and working independently. Students will use the bands at either their desk or at a whole group table with a chair and avoid having to get up or be asked to stop moving. Movement is the key to keeping students with ADHD and other disabilities focused and finishing up their assignments or staying on task while the teacher is teaching. \r\n My goal is to help my students learn helpful strategies that will allow them to join their peers in the general education setting. By learning how to maintain focus by getting their wiggles and extra energy and grow academically. nannan

My students are bright eyed and starving for knowledge. My Pre-K -1 children are like a sponge, they want to learn everything and they learn so much by using their senses and intuition. Although my students are on the Autistic spectrum they are just as curious and want what all children want which is to have fun, be accepted by their peers and mentors, feel safe and comforted, explore the world around them and they want to experience and learn new things. My students have language and speech delays and verbal communication is very difficult. My students use a picture exchange communication system and are learning to read and write. \r\n\r\nThe Boogie Boards will be a great tool for my students to use. They will be able to write and use these boards to communicate. It will also motivate them to learn. The size and different textures of the stylus will make it easy for my students to hold the stylus. My students's fine motor skills are also low. \r\n\r\n\r\nThe Magnetic board, Magnetic Letters and stamps will be a great addition to help facilitate language. \r\nnannan

print(len(tfidf_w2v_title)) print(len(tfidf_w2v_title[0]))
```

1.4.3 Vectorizing Numerical features

In [93]:

```
# the cost feature is already in numerical values, we are going to represent the money, as numeri
cal values within the range 0-1
# normalization sklearn: https://scikit-
learn.org/stable/modules/generated/sklearn.preprocessing.StandardScaler.html
from sklearn.preprocessing import StandardScaler

# price_normalized = standardScaler.fit(project_data['price'].values)
# this will rise the error
# ValueError: Expected 2D array, got 1D array instead: array=[725.05 213.03 329.    ... 399.    287.
73    5.5 ].
# Reshape your data either using array.reshape(-1, 1)

price_scaler = StandardScaler()
price_scaler.fit(project_data['price'].values.reshape(-1,1)) # finding the mean and standard
deviation of this data
print(f"Mean : {price_scaler.mean_[0]}, Standard deviation : {np.sqrt(price_scaler.var_[0])}")

# Now standardize the data with above maen and variance.
price_normalized = price_scaler.transform(project_data['price'].values.reshape(-1, 1))
```

```
Mean : 299.33367619999996, Standard deviation : 378.20927190421384
```

In [94]:

```
price_normalized
```

Out[94]:

```
array([[ -0.38268146],
       [ -0.00088225],
```

```
[ 0.57512161],
...,
[-0.65382764],
[-0.52109689],
[ 0.54492668]])
```

1.4.4 Merging all the above features

- we need to merge all the numerical vectors i.e categorical, text, numerical vectors

In [95]:

```
print(categories_one_hot.shape)
print(sub_categories_one_hot.shape)
print(text_bow.shape)
print(price_normalized.shape)
```

```
(50000, 9)
(50000, 30)
(50000, 12211)
(50000, 1)
```

In [96]:

```
# Assignment 3: Apply KNN# merge two sparse matrices: https://stackoverflow.com/a/19710648/4084039
from scipy.sparse import hstack
# with the same hstack function we are concatenating a sparse matrix and a dense matrix :)
X = hstack((categories_one_hot, sub_categories_one_hot, text_bow, price_normalized))
X.shape
```

Out[96]:

```
(50000, 12251)
```

Assignment 4: Naive Bayes

1. Apply Multinomial NaiveBayes on these feature sets

- **Set 1:** categorical, numerical features + project_title(BOW) + preprocessed_eassay (BOW)
- **Set 2:** categorical, numerical features + project_title(TFIDF)+ preprocessed_eassay (TFIDF)

2. The hyper paramter tuning(find best Alpha)

- Find the best hyper parameter which will give the maximum [AUC](#) value
- Consider a wide range of alpha values for hyperparameter tuning, start as low as 0.00001
- Find the best hyper paramter using k-fold cross validation or simple cross validation data
- Use gridsearch cv or randomsearch cv or you can also write your own for loops to do this task of hyperparameter tuning

3. Feature importance

- Find the top 10 features of positive class and top 10 features of negative class for both feature sets **Set 1** and **Set 2** using values of `feature_log_prob_` parameter of [MultinomialNB](#) and print their corresponding feature names

4. Representation of results

- You need to plot the performance of model both on train data and cross validation data for each hyper parameter, like shown in the figure. Here on X-axis you will have alpha values, since they have a wide range, just to represent those alpha values on the graph, apply log function on those alpha values.
- Once after you found the best hyper parameter, you need to train your model with it, and find the AUC on test data and plot the ROC curve on both train and test.
- Along with plotting ROC curve, you need to print the [confusion matrix](#) with predicted and original labels of test data points. Please visualize your confusion matrices using [seaborn heatmaps.](#)

5. Conclusion

3. Conclusion

- [You need to summarize the results at the end of the notebook, summarize it in the table format. To print out a table please refer to this prettytable library link](#)

In [97]:

```
Y = project_data['project_is_approved'].values
del project_data['project_is_approved']
project_data.columns
#project_data.loc[:, project_data.columns != 'project_is_approved'].values
#X1 = np.array(preprocessed_essays)
#X2 = project_data['preprocessed_project_title'].values
```

Out[97]:

```

TOP 10 positive Features

NOTE¶ Using argsort by default it sorts in ascending order, but we need sorted log probabilities in desc order.

While sorting the log probabilities in ascending order we get least imp features because just for an example say f1 has prob 16 and f2 has prob -14 .The actual prob of f1 would be $\exp(-16)$ and actual prob of f2 would be $\exp(-14)$. Clearly f2 has higher prob so it is an imp feature

MultinomialNB(alpha=0.1, class_prior=[0.5, 0.5], fit_prior=True)
{'alpha': 0.1}

```

In [191]:

```

# from the error plot we choose K such that, we will have maximum AUC on cv data and gap between t
he train and cv is less

```

```

# Note: based on the method we use we can select different hyperparameters and use best one

```

```
# Note: based on the method you use you might get different hyperparameter values as best one
# so, you choose according to the method you choose, you use gridsearch if you are having more computing power and note it will take more time
# if you increase the cv values in the GridSearchCV you will get more robust results.

#here we are choosing the best k based on forloop results
best_k = clf.best_params_['alpha']
```

2. Testing with Test data

In [192]:

```
# https://scikit-learn.org/stable/modules/generated/sklearn.metrics.roc_curve.html#sklearn.metrics.roc_curve
from sklearn.metrics import roc_curve, auc

nb = MultinomialNB(alpha=best_k, class_prior=[0.5, 0.5])

Out[199]:

9110

TOP 10 positive Features

NOTE¶ Using argsort by default it sorts in ascending order, but we need sorted log probabilities in desc order. While sorting the log probabilities in ascending order we get least imp features because just for an example say f1 has prob 16 and f2 has prob -14. The actual prob of f1 would be $\exp(-16)$ and actual prob of f2 would be $\exp(-14)$. Clearly f2 has higher prob so it is an imp feature

In [201]:

```
